I have built a website which uses php to generate forms etc. My website doesn't hold any sensitive information, it simply sends an email every time someone submits a form. I have the option of making the email sent from my site, to a Gmail account - that's the option I'm currently using. However, I'm worried that the email may be intercepted by the Gmails servers - in which case, the Gmails servers may know what my website is sending, thus leaking my information. How can I secure my website? A: You are not going to be able to secure your website as it is without setting up some sort of proxy. A: The most secure solution is to have a service somewhere on the internet on your own domain or in your own intranet/office which you can use to send your e-mails from. Then this service will be more trustworthy and the communication between your webserver and your e-mail server more secured. That said, if you don't have such a service ready yet, you can also use google's SMTP service (Even though it doesn't look as safe as using your own service, it should at least be more secure than using GMail directly. i s - 4 8 8 4 (b a s e 1 2) i n b a s e a l d647c40b
