· RunAsGUI Configuration Wizard. This module allows administrators to configure execution parameters and save them in a RAG extension (for later use by the Client Utility).

· RunAsGUI Client Module. This module allows non-privileged users to run applications / scripts with restricted privileges, such as executing as a non-administrator user. The application allows you to encrypt credentials of a privileged user and allow non-privileged users to run applications / scripts using the encrypted credentials.

The application contains command line options for RunAsGUI. You can use them to create a RAG file (.RAG file) in which you will save user's credentials. You can then run the application to create a new configuration file for the clients. This configuration file is encrypted and can be distributed to the clients. The user's credentials are also encrypted and can be decrypted using a password of your choice. RunAsGUI

Features:

- Encrypt/Decrypt credentials
- Decompress/Compress files
- Generate/Read password · Copy/Move files
  - Run commands · Copy/Move files
  - Disconnect · Set/Get passwords
- Update/Get RAG extension · Revert

More Info: The configuration file (.RAG file) can be created at any time and can be used by any number of users. The RAG extension, because of its characteristics, is not compatible with standard configuration files and some security software (especially

---

Microsoft and Symantec) may cause problems for users. In this case, we suggest that it should not be used. If you want to use this configuration file, be sure to check your software (and configure it) beforehand to understand any security implications. If you want to use RunAsGUI, we recommend installing it on a workstation which will be used only for this purpose, or on a workstation which will be used by only one user. The Client Module, which is installed by default, is not intended for commercial uses. RunAsGUI is a highly secured solution for users who need to run privileged applications from a non-privileged account, as well as have the ability to display a logon window. The decrypted configuration file includes a list of commands that will be executed.

RunAsGUI allows you to configure execution parameters, save them in a RAG file and run applications, scripts and commands using the encrypted credentials.

RunAsGUI allows users to encrypt the Windows credentials of the privileged user.

Once the user logs in, the application displays a configuration wizard that allows you to:

- Save the desired configuration to RAG file, which can then be shared to end users.
- Configure the display of a logon window.
- Optionally display the encryption of the privileged user's Windows account and password.
- Obtain the user's Windows credentials for the current session by clicking

---

the Log in button. · Be notified by e-mail when it is time to exit the configuration wizard and change the passwords. To protect these passwords, RunAsGUI uses a one-way encryption mechanism. This means that your application can only use the decrypted credentials, and not the other way around. The configuration file is encrypted by default. It contains encrypted credentials for the application and the privileged user's credentials. It is therefore important to note that the program's administrator must enable you to access the configuration file, so that you can provide the credentials to end users. To encrypt the credentials of the privileged user's Windows account in the configuration file, click on the 'Encrypt Windows credentials' button. This option is only available if you have enabled the option to access the configuration file. RunAsGUI Feature: RunAsGUI allows you to run applications, scripts or commands using the credentials of a privileged user. It is important to note that the configuration file

---

used by the client utility contains the credentials of the privileged user. When the user logs in to Windows, RunAsGUI will encrypt the credentials of the Windows account and provide them to the privileged user. This allows you to run Windows applications or scripts using the credentials of a privileged user. The RunAsGUI Client Module: The Client Module is a dynamic library that can be used by other software. It is not a stand-alone application that runs on the user's workstation. This module reads the encrypted configuration file, and using the credentials of the privileged user runs the applications, scripts or commands defined in the

- Client Utility The RunAsGUI Client Utility is a GUI client and administrator utility that contains the configuration and implementation of the RunAsGUI function. You can configure the utility using the Configuration Wizard, and execute your programs and scripts using the encrypted configuration. The Client Utility requires that you have the RAG file. It can be installed on the user's workstation or run from the network.

is created based on the parameters that you configure using the wizard. You can save the RAG file as a .rag extension file. If you want to share your configuration on a network, you can save the RAG file by encrypting the configuration data using the Password of a Windows account. For example, the password of the administrator account. The RAG file is a simple text file containing a .Cmd extension. In addition, the client utility is installed at installation time, so you can save and read the RAG file in the Client Utility.
