Q: Why did Soltsev remove the slashes? In his peshnam photo project, Soltsev uses an image of the "Konkordzinskij Dog Brothers' Cemetery" (web). However, the photo has slashes through the graves. He posted the photo on Instagram, and when I asked him about the slashes, he said the slashes were necessary to "make more life" to the image. It was my understanding that in black and white photography, slashes produce positive results, so I asked him how he would say to Photoshop the slashes back in. He said the slashes were supposed to be something that we would not think about. The image was not supposed to be black and white, so, ideally, it would be red, which is so hard to see. At this point, it is a real mystery for me. I will have to solve the mystery by myself, but I want to know your opinion about this. A: I am not a photographer and have no expertise in such matters. I think I can say that the final cropping with the slashes will have a definite effect on the overall result. An image with few details is "one dimensional". It is much harder to tell a simple story with it. If you remove the slashes, then it is not easy to tell which one is a dog and which one is a person. And this is the main point, the one with the dogs have the "charm", the one with the person is plain and boring. Slashes make the dogs stand out, and this is the main objective of the project. I do not know if the picture has been cropped in the beginning, and the slashes were simply added by the photographer. But I guess the final image will look much better if he would make it with the least amount of slashes. The long wait is finally over! We have some exciting news for you this week! Team Liquid has officially signed a multi-year partnership with NBA.com/league pass, the league's official mobile app, and will be releasing an all new Liquid Basketball video series that will feature exclusive coverage of League of Legends, the ultimate team-based online competitive league. On top of that, the franchise has also announced their first roster addition – none other than Mr. Chris "PapaSmithy" Smith, the legendary coach behind Cloud 9

1. Field of the Invention This invention relates to a semiconductor device having a circuit equipped with thin film transistors (hereinafter referred to as TFTs) and to a method of manufacturing the semiconductor device. The semiconductor device of the present invention is used in liquid crystal displays and EL (Electro Luminescence) displays. 2. Description of the Related Art Thin film transistors (hereinafter referred to as TFTs) which are formed on glass substrates or plastic substrates are used in liquid crystal displays and EL displays. A TFT requires a channel forming region between a source region and a drain region of the TFT, and a region where current between the source region and the drain region flows between the channel forming region and the source region. The channel forming region and the region where current flows are called the channel region and the source region or drain region, respectively. The source region and the drain region are formed as parts of an electrode which is formed on the substrate. The substrate on which the TFT is formed will be explained. FIG. 1 is a sectional view of an example of the substrate on which the TFT is formed. In FIG. 1, the substrate on which the TFT is formed includes an insulating substrate 101, a gate electrode 102 formed on the insulating substrate 101, an interlayer insulating film 103 on the gate electrode 102, a semiconductor layer 104 on the interlayer insulating film 103, a source electrode 105, and a drain electrode 106. The gate electrode 102 is composed of a metal such as Al or Al alloy, and the semiconductor layer 104 is composed of a silicon layer or a silicon semiconductor such as polycrystalline silicon (polysilicon) or microcrystalline silicon. The source electrode 105 is composed of a metal such as Al or Al alloy, and the drain electrode 106 is composed of a metal such as Al, Cr, Ta, Mo, or a silicide of any of the metals. There are many cases where the TFT used in a liquid crystal display or the like is formed on a substrate such as a glass substrate or a quartz substrate. These substrates are expensive, and their production cost is very high, so that the use of such a substrate is undesirable. On the other hand, a plastic substrate such as a plastic film is cheap, but it is inferior to the glass substrate or the quartz substrate in heat resistance and solvent resistance. For this reason, it
