Astrophysicists now believe that a substantial portion of the universe consists of invisible material that holds galaxies together, but that they have not yet been able to trace. Dark matter affects the motion of galaxies and the distribution of stars, and can only be detected indirectly by the gravitational effect that it has on visible matter. [back to top] A larger computer at UT Austin has run hundreds of tests that show dark matter is the answer to the question: Where did the universe come from? The Universe is more than 13 billion years old. Why does it take so long to begin with and why does it have so little mass? Astrophysicists have shown that there is a lot of matter in the universe, in the form of stars, stars, galaxies, etc. They have observed the motion of these objects and they have found that they are all in groups or clusters. But where did all the matter come from that holds them together? a1d647c40b
